

HermesEnterprise

Enterprise Intelligence Engine

Revenue Leakage Detection · Cost Anomaly Identification · Lease Optimisation

CUSHMAN & WAKEFIELD — CONFIDENTIAL PROPOSAL

EXECUTIVE SUMMARY

Hermes Enterprise is an AI-powered financial intelligence platform that connects directly to your JD Edwards ERP data to automatically surface revenue leakage, cost anomalies, and lease optimisation opportunities — before your team finds them the hard way.

Built on a **deterministic detection first, LLM reasoning second** architecture, every finding is traceable to source data and auditable. The system runs locally inside your environment — your financial data never leaves your network.

On synthetic JDE data, the prototype identified **\$419,000+ in financial exposure** across 26 findings — AP duplicates, underpriced leases, overdue AR, vendor concentration risk — in under 60 seconds of analysis.

26 FINDINGS DETECTED	\$419K TOTAL EXPOSURE	<60s ANALYSIS TIME	4 DETECTION LAYERS
-----------------------------------	------------------------------------	------------------------------------	---------------------------------

THE PROBLEM

Commercial real estate portfolios managed on JD Edwards generate thousands of financial transactions every month. The data needed to identify financial risk lives in four JDE tables — but no standard reporting tool connects the dots.

Lease Underpricing

Properties are renewed below market rate without anyone noticing. Each 10% shortfall on a \$500K/year lease costs \$50,000 annually — compounded over renewal terms.

Duplicate Payments

AP teams processing high volumes miss exact and near-duplicate invoices. Manual reconciliation catches some — but not all, and not before payment runs.

Overdue AR

Outstanding invoices age without escalation. Cash flow erosion from uncollected receivables is invisible until it materially impacts working capital.

GL Anomalies

Round-number journal entries and duplicate posting lines are manually reviewed on a sample basis — leaving exposure for the entries nobody looks at closely enough.

HOW IT WORKS

The system integrates with JDE through standard CSV exports — no database credentials, no ETL pipeline, no IT project. Your team exports four JDE tables on a schedule, drops them into Hermes, and receives a full intelligence report.

CEO Dashboard

The live web dashboard gives executives a real-time view of all detected issues — filterable by urgency, type, and entity — with full detail on every finding at the click of a card.

PDF Intelligence Report

Every analysis produces a polished executive PDF report — formatted for CFO and board distribution, with full audit trails and recommendations.

Detects round-number journal entries (potential manual overrides) and duplicate line items posted across periods. Complements Layer 2 AP detection with full ledger coverage.

- Critical (>60 day) — escalate immediately
- High (>45 day) — initiate collections
- Float benefit detection on early pay

- Round-number anomaly detection
- Duplicate GL line items
- Contract vs. invoice rate drift

SAMPLE FINDINGS

The following findings were generated from synthetic JDE test data. Real client data will produce findings specific to your portfolio — with actual dollar amounts tied to actual contracts.

URGENCY	TYPE	ENTITY	ISSUE	IMPACT
HIGH	Lease Underpricing	Collins St Tower, Unit 8A	Current rent 18.7% below market — \$31,200/yr below comparable rate	\$31,200/yr
HIGH	AP Duplicate Payment	Vendor: Office Essentials Pty Ltd	Invoice INV-2024-0847 paid twice within 5 days — identical amount	\$4,872
HIGH	AR Collection Risk	Customer: TechCorp Holdings	3 invoices overdue 67 days — total outstanding \$127,400	\$127,400
MEDIUM	Lease Expiry Risk	Pitt St Tower, Floors 12–15	Lease expires in 52 days — no renewal documentation on file	\$180,000/yr
MEDIUM	Vendor Concentration	Vendor: Capital Electrical	34% of total AP spend with single vendor —	Policy breach

URGENCY	TYPE	ENTITY	ISSUE	IMPACT
			concentration risk	
LOW	Early Payment	Vendor: Urban Maintenance Co.	Paid 18 days early — missed float benefit of ~\$890	\$890

IMPLEMENTATION TIMELINE

Hermes Enterprise is deployed as a self-contained client package. A typical implementation involves connecting your JDE environment, validating data mappings, and running the first analysis — all within four weeks.

- 1 Discovery & Data Mapping**
 Review JDE table structures (F1501, F0411, F03B11, F0911). Map field names to Hermes detection schemas. Validate CSV export format with your IT team.
 WEEKS 1–2
- 2 Prototype Validation**
 Run first analysis on historical data (12-month window). Validate detection thresholds against known issues. Calibrate sensitivity to your portfolio's noise floor.
 WEEKS 2–3
- 3 Live Deployment**
 Deploy Hermes in your environment. Connect to live CSV exports or automate via JDE scheduled reports. CEO dashboard deployed on internal server or local workstation.
 WEEK 3

4

Recurring Intelligence

Establish weekly or monthly analysis cadence. Findings reviewed in standing finance meeting. Open findings tracked to resolution. New detection rules added as portfolio evolves.

MONTH 2 ONWARDS

INVESTMENT

Foundation

Single business entity

\$12,500/month

- ✓ Detection engine (all 4 layers)
- ✓ LLM reasoning enrichment
- ✓ CEO dashboard (internal)
- ✓ Monthly PDF intelligence report
- ✓ Up to 50,000 transactions/analysis
- ✓ Email support

Portfolio

Multi-entity / portfolio view

\$24,500/month

- ✓ Everything in Foundation
- ✓ Unlimited entities
- ✓ Portfolio-level rollup dashboard
- ✓ Automated weekly cadence
- ✓ API access for BI tools
- ✓ Dedicated analyst support

Enterprise

Full JDE integration

Custom

- ✓ Direct JDE API read (F1501/F0411/F03B11/F09)
- ✓ SmartBar integration
- ✓ Real-time alerting
- ✓ SSO / Active Directory
- ✓ SLA-backed uptime
- ✓ Custom detection rules

All plans include a 30-day pilot with full functionality — if you don't see findings worth acting on, you don't pay. Implementation and onboarding are included at no additional cost.

WHY HERMES ENTERPRISE

Privacy-First Architecture

Your financial data never leaves your environment. Hermes runs locally — on a workstation, file server, or internal cloud instance. No data is uploaded to external services. No third-party gets access to your ledger.

Deterministic + Auditable

Every finding traces back to a specific JDE table, invoice number, or lease record. LLM reasoning adds narrative — but the underlying detection logic is rule-based and inspectable. No black-box AI.

Immediate Time-to-Value

CSV exports from JDE are all that is required to get started. No database credentials, no ETL, no multi-month IT project. First findings within days of engagement signing.

Built for CRE Portfolios

Unlike generic financial audit tools, Hermes is designed specifically for commercial real estate — F1501 lease structures, AP accruals, AR escalation curves, and GL patterns that matter to property managers.

READY TO FIND THE LEAKAGE IN YOUR PORTFOLIO?

We propose a 30-day pilot on your historical JDE data — at no cost and no commitment.

If Hermes doesn't surface findings worth acting on, we part ways. If it does, you decide.
